

## **Addendum to Request for Expression of Interest for an Inmate tracking system for the Correctional Facility of Aruba (KIA)**

Pursuant to the REOI the following request for additional information has been received, which, together with the answers thereto, are hereby issued as an addendum to the Expressions of Interest process.

A request to provide the following information has been received (summary):

1. Information as to the areas within which tracking need to take place (include exterior areas if applicable);
2. Type and number of each tag required (e.g. Inmate, Asset, Staff, Visitor).

Answer to sub 1: for security reasons no detailed information of specific areas of the facility can be provided and in any case is not deemed necessary in this stage: the inmate tracking needs to be for the whole area of the facility and at least for an area surrounding the facility. As stated in the REOI: ‘The Inmate tracking system to be applied shall function in a cost effective manner as can be reasonably expected, consisting of relevant core equipment (hard-, software and wireless connectivity system, bracelets or wristbands, etc. etc.) with a proven track record to monitor and track subjects real time, be highly resilient to tampering, promptly alert if the subject attempts to or leaves the relevant area or premises, or tries to tamper with or block the reception of signals, be able to track a subject beyond premises, and require minimal routine maintenance. In other words, the primary goal of the system to be introduced is to avoid inmates escaping and if an attempt occurs, to be able to have at least a certain parameter/ buffer tracking zone around the prison facilities through which the subjects can be traced swiftly.

The total build up area of the prison facilities is approximately 11.500 m<sup>2</sup>, the buildings are located within a 6 m high concrete wall, which covers apr 225x135 m<sup>2</sup> area and the total external fenced property of the complex is approximately 250 x250 m<sup>2</sup>.

As stated in the REOI, due to the fact that the MJSIA is striving to procure for a new correctional facility, it must be taken into consideration that the Inmate tracking system should be able to be moved and applied in the new facility without major cost, other than those which could be reasonably expected.

Answer to sub 2. As per sub 1 of the REOI: ‘The Inmate tracking system should have a flexible and easily scalable capacity to monitor an average of 250 up to 300 subjects, from a central location to be determined.’. The system should be able to track specifically and primarily inmates, through either ankle bracelets or wristbands, and readers, their location and movements, as well as perform automated headcounts of the subjects, logging cell and security checks through fixed sensors, etc. etc.
